

ABSTRACT

A method for manufacturing a sheet with protruding texture is disclosed. The sheet can be made as a pad or curtain sheet. The method comprises the steps of: outputting a bottom film outputted from a
5 bottom film supplier; passing the bottom film around a transfer roller, supplying heating rubber material as a texture material from a texture material supplier and then dropping upon the bottom film on the transfer roller; removing the residual heating rubber material on the transfer roller by a material remover; transferring the bottom plate to a removing roller
10 behind the transfer roller for separating the bottom plate, wherein at this stage, the texture has condensed into solid state; and sending the bottom plate to at least one pair of printing roller; each pair of printing rollers being placed at two sides of the bottom plate so as to print dyes upon the texture.
